Chapter 1

Solutions of Fiche TP-03

Notes regarding this solution :

This solution and the executions of the code in it was done in the following machine :

• PC: Lenovo IdeaPad S210 8GB

• OS: Linux Mint 20.2 Cinnamon Kernel v.5.4.0-88

• *Bison* : v3.5.1

• *Flex* : v2.6.4

• gcc: v9.3.0

1.1 Exercise 1

Nous avons défini, dans le TP 3, l'analyseur syntaxique pour notre mini calculateur. L'objectif de ce présent TP, consiste à évaluer les expressions arithmétiques syntaxiquement correctes. Pour cela, il faut apporter les modifications suivantes aux deux analyseurs lexical et syntaxique comme suit :

1.1.1 1. Apporter les modifications nécessaires aux deux analyseurs lexical et syntaxique.

cal.y file

```
응 {
1
   #include <stdio.h>
2
   void yyerror(char *);
  int yylex(void);
   응 }
5
   %token Tnb
6
   %left '+' '-' '*' '/'
7
   응응
8
9
10
   P:P S '\n'
11
12
   13
    ;
14
15
   S:E { printf("%d\n", $1); }
16
17
18
19
   E:Tnb
20
   | '-'  E { $$ = -$2; }
21
    \mid E'+' E \{ \$\$ = \$1 + \$3; \}
22
    | E '-' E { $$ = $1 - $3; }
23
    \mid E' *' E \{ \$\$ = \$1 * \$3;
24
   \mid E'' \mid E \{ \$\$ = \$1 * \$3; \}
25
   (' (' E ')' \{ \$\$ = \$2; \}
26
27
28
29
30
   void yyerror(char *s) {
31
   fprintf(stderr, "%s\n", s);
32
33
   int main()
35
   if (yyparse() != 0)
36
37
   fprintf(stderr, "Syntaxe incorrecte\n");
38
   return 1;
39
40
  else return 0;
41
42
  }
```

cal.y file

```
응 {
43
   #include "cal.tab.h"
44
   #include <stdlib.h>
45
   void yyerror(char *);
46
   응 }
47
   응응
48
  [0-9]+ {yylval = atoi(yytext); return Tnb;}
  [-+()*\n/] { return *yytext; }
50
   [\t];
51
   . {printf("Caractere (%c) non reconnu\n", yytext[0]); exit(0);}
52
53
  int yywrap(void) {
54
   return 1;
55
```

1.1.2 2. Recompiler les différents analyseurs.

execution of commands

- 1. flex cal.l
- 2. bison -d cal.y
- 3. gcc lex.yy.c cal.tab.c -o calc
- 4. ./calc
